

Machine Learning-Powered Product categorization to increase conversion rates

Business:

Machine Learning

Domain:

eCommerce

Tools:

Python, Scikit Learn, Jupyter Notebook (for prototyping), PySpark, Pickling using Django/ Flask (for scaling and production)

Key Highlights

Key Success:

- » The product categorisation model achieved a 75% accuracy in classifying the products
- » 3% increase in conversion rates across all Product Categories, which led to a 20% increase in GMV.

Engagement:

- » Offshore engagement with:
 - 1 Blockchain Architect
 - 2 Blockchain Engineers
- » 4 months

Hardware Stack:

Windows 8GB RAM (for prototyping)
AWS 128GB EC2 machines (for scaling)

Client

The client is an AI-powered e-commerce aggregator website which delights customers by providing them with smart buying options.

Overview

As with any online retailer, product categorization is an indispensable functionality required to offer both text and text-free searches, recommendations and up-selling. While the client was capable of categorization on a retailer's website, it was experiencing insurmountable challenges across multiple websites. Indium Software leveraged its expertise in Advanced Machine Learning and Artificial Intelligence to devise a "name matching" model that overcame these obstacles improving the accuracy of the listings on the client's website.

1 Challenges

The client is an AI-powered e-commerce aggregator website which delights customers by providing them with smart buying options. The product categorization is indispensable for e-commerce websites. It makes free-text searches faster and provides better user experience by highlighting top categories upfront.

While this categorization works well on retailer websites, it becomes an issue for e-commerce aggregators. The product categories are defined differently by different retailers for the same product. This creates a problem in assigning the same product from different retailers to the same categories due to which the quality of search results and user experience suffer.

There was a need for Advanced Machine Learning and Artificial Intelligence techniques to be deployed to solve some of the most complex problems the industry faces. In particular, this would be a case on how we solved the nagging problem of product categorization.

2 Indium Software's Approach and Implementation

Here is a summary of the steps involved and the methods used in each step of this process.

- » Data Sampling
 - To get equal representation from each category
 - Methods: Stratified Random Sampling
- » Pre Processing
 - Convert Text to a numeric representation
 - Methods: TF-IDF, N grams, Stop words, stemming lemmatization
- » Model Training
 - Fit classification models to training data
 - Naive Bayes, Support Vector Machines
- » Parameter Tuning
 - Find model parameters that give the highest accuracy
 - Grid Search (Scikit-learn), Cross Validation
- » Model Nesting
 - Train separate models for different levels of hierarchical groups
 - Group By methods, For-loops, Sub-setting
- » Production
 - Setting up infrastructure for the trained model to be utilized
 - Pickling, Django, JavaScript

3 Business Impact

- » Model trained achieved an accuracy of 75% in accurately predicting categories for new products.
- » Improved Product Categorization lead to superior indexing of products which directly contributed towards providing better search results.
- » 3% increase in Conversion rates across all Product Categories which led to a 20% increase in GMV.
